

Databricks Notebooks

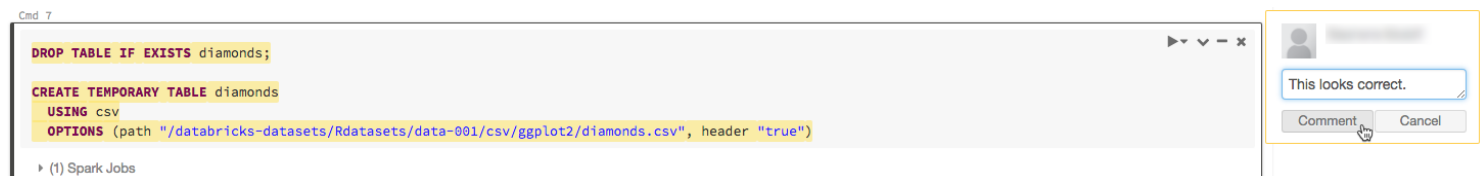

Last updated by | Morgan Mick | Feb 19, 2019 at 10:58 AM GMT

For Databricks Notebook Peer reviews

The following checklist should be reviewed against the notebook code (strictly in the Feature branch of its respective repository)

- Coding Standards (python, scala, SQL specific or general?)
- Configurations
- Code Logic against the User Acceptance Criteria of the task (should we add comments to the code that links the notebook to the DevOps task?)
- Are there sufficient unit tests?
- Are there any unused library functions, variables etc?
- Are classes, methods, objects and variables logically named?
- Is this being implemented with the correct approach?
- Is this being implemented in the right place within the existing codebase?
- Are there sufficient comments and samples / fixtures for larger data structures?
- Are there any remaining calls for a deleted variable / constant / method?

Comments can added to the Notebook by either highlighting the cell or the text with in the cell.

For more information in regards to Notebook Comments see <https://docs.databricks.com/user-guide/notebooks/notebook-use.html#command-comments>
