Currently this class' sole purpose is to interact with the AWBISystem Azure database. In future it will be extended to work with multiple database as required. Currently, as part of MVP there is only a single database to interact with.

Method Name	Description	Arguements	Input	Output
dfToTable	Converts a dataframe into a temp view	df, tempTable	classDatabase.dfToTable(myDf, 'myTempView')	select * from myTempView
sqlRead	Reads a SQL table from the database and returns either a global or temp table	tableName, type="temp"	classDatabase.sqlRead('myDatabaseTable')	select * from myDatabaseTable
sqlWrite	Writes a dataframe to a target table	df, tableName	classDatabase.sqlWrite(myDf, 'myDatabaseTable')	No output expected (dataframe contents should now be visible from the external database)
mapDataframeToEntity	Manages the initial and all future changes to entity columns within AWBISystem Metadata.EntityColumns	df, entityId	classDatabase.mapDataframeToEntity(myDf, 100)	No output expected (entity column definitions should be up-to-date in the external table)
