

Databricks and Python Error handling example

Last updated by | Morgan Mick | Jul 9, 2019 at 4:56 PM GMT+1

Example of basic error handling in Python with databricks logging

The try block lets you test a block of code for errors.

The except block lets you handle the error.

The finally block lets you execute code, regardless of the result of the try- and except blocks.

```
%run "../shared/function/python/loggingDriver"
```

```
import traceback

try:
    raise ValueError

except ValueError:
    tb = traceback.format_exc()
    msgE="Error originated from loggingTest.cmd2"
    com_awsawbi_databrickslogging_initlog_appendlog("E",msgE)

else:
    try:
        raise ValueError

    except:
        msgE="Uncaught Error originated from loggingTest.cmd2"
        com_awsawbi_databrickslogging_initlog_appendlog("E",msgE)

tb = "no error"

finally:
    print(tb)
```
