

Databricks logging Python

Last updated by | Wesley Boyd | Jul 23, 2019 at 1:40 PM GMT+1

Example logging for Scala

Key package is `com_awsawbi_databrickslogging_initlog_appendlog`. This accepts two arguments, type of logging and message envelop itself.

```
%run "../shared/function/python/loggingDriver"

%python
# Python Logging test

msgW="Warning originated from LATest"
msgT="Trace originated from LATest"
msgD="Debug originated from LATest"
msgE="Error originated from LATest"
msgI="Info originated from LATest"

com_awsawbi_databrickslogging_initlog_appendlog("W",msgW)
com_awsawbi_databrickslogging_initlog_appendlog("T",msgT)
com_awsawbi_databrickslogging_initlog_appendlog("D",msgD)
com_awsawbi_databrickslogging_initlog_appendlog("E",msgE)
com_awsawbi_databrickslogging_initlog_appendlog("I",msgI)
```

This is currently available on spark standard output console. Work is still under progress on integrating log4j directly into Log Analytics so these log entries can be directly queried using K-SQL. However this change will be log4j config change but functional implementation remains same as above example.

Example logging available in spark standard output console

```
com_awsawbi_databrickslogging_initlog_appendlog: 2019-05-01 14:35:17 : Warning originated from LATest
com_awsawbi_databrickslogging_initlog_appendlog, 2019-05-01 14:36:17, Warning originated from LATest
com_awsawbi_databrickslogging_initlog_appendlog, 2019-05-01 14:39:26, Warning originated from LATest
com_awsawbi_databrickslogging_initlog_appendlog, 2019-05-01 14:39:26, Trace originated from LATest
com_awsawbi_databrickslogging_initlog_appendlog, 2019-05-01 14:39:26, Debug originated from LATest
com_awsawbi_databrickslogging_initlog_appendlog, 2019-05-01 14:39:26, Error originated from LATest
com_awsawbi_databrickslogging_initlog_appendlog, 2019-05-01 14:39:26, Info originated from LATest
```

Currently a python package is placed under `../shared/function/python/loggingDriver` - this will be eventually part of master init script
