

Source Control and Databricks - Alternate approach -2

Last updated by | Moupiya Das | Apr 24, 2019 at 11:47 AM GMT+1

1. Create a new branch in repo
2. Visual Studio --> Team Explorer --> Connect to the repo
3. Create new notebook/update existing in databricks portal
4. Download the notebook from step 3 to local repo (CMD)

```
C:\Users\moudas>cd C:\Users\moudas\source\repos\Framework-Processing\processingFramework\endPoints

C:\Users\moudas\source\repos\Framework-Processing\processingFramework\endPoints>databricks workspace export /Users/moudas@anglianwater.co.uk/AWBI/processing/processingFramework/endPoints/processSimWave2Dataset . -o

C:\Users\moudas\source\repos\Framework-Processing\processingFramework\endPoints>
```

databricks workspace export

```
/Users/{userDetails}/AWBI/processing/processingFramework/endPoints/processSimWave2Dataset . -o
```

5. Notebook will appear in Visual studio with latest code
6. Right click the changed/new notebook and select stage and then commit --> sync --> push --> new pull request
